Introduction and Basic Implementation for Finite Element Methods

Chapter 3: Finite Elements for 2D second order elliptic equation

Xiaoming He
Department of Mathematics & Statistics
Missouri University of Science & Technology

Outline

- Weak/Galerkin formulation
- PE discretization
- 3 Dirichlet boundary condition
- 4 FE Method
- More Discussion

- Weak/Galerkin formulation

Consider the 2D second order elliptic equation

$$-\nabla \cdot (c\nabla u) = f, \text{ in } \Omega$$
$$u = g, \text{ on } \partial \Omega.$$

Dirichlet boundary condition

where Ω is a 2D domain, f(x, y) and c(x, y) are given functions on Ω , g(x, y) is a given function on $\partial \Omega$ and u(x, y)is the unknown function.

• The gradient of a 2D function u is defined by

$$\nabla u = (u_x, u_y).$$

• The divergence of a 2×1 vector \overrightarrow{v} is defined by

$$\nabla \cdot \overrightarrow{v} = \frac{\partial v_1}{\partial x} + \frac{\partial v_2}{\partial y}.$$

• First, multiply a function v(x, y) on both sides of the original equation,

Dirichlet boundary condition

$$\begin{aligned}
-\nabla \cdot (c\nabla u) &= f \text{ in } \Omega \\
\Rightarrow &-\nabla \cdot (c\nabla u)v = fv \text{ in } \Omega \\
\Rightarrow &-\int_{\Omega} \nabla \cdot (c\nabla u)v \, dxdy = \int_{\Omega} fv \, dxdy.
\end{aligned}$$

• u(x, y) is called a trail function and v(x, y) is called a test function.

• Second, using Green's formula (divergence theory, integration by parts in multi-dimension)

$$\int_{\Omega} \nabla \cdot (c \nabla u) v \, dxdy = \int_{\partial \Omega} (c \nabla u \cdot \vec{n}) v \, ds - \int_{\Omega} c \nabla u \cdot \nabla v \, dxdy,$$

Dirichlet boundary condition

we obtain

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy - \int_{\partial \Omega} \left(c \nabla u \cdot \vec{n} \right) v \ ds = \int_{\Omega} f v \ dx dy.$$

Weak formulation

- Since the solution on the domain boundary $\partial\Omega$ are given by u(x,y)=g(x,y), then we can choose the test function v(x,y) such that v=0 on $\partial\Omega$.
- Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy = \int_{\Omega} f v \, dx dy.$$

What spaces should u and v belong to? Sobolev spaces!

Definition (Support)

If u is a function defined on a domain Ω , then its support supp(u) is the closure of the set on which u is nonzero.

Definition (Compactly supported)

If u is a function defined on a domain Ω and supp(u) is a compact subset (that is, a closed and bounded subset), then u is said to be compactly supported in Ω .

Lemma (I)

A function compactly supported in Ω is zero on and near the boundary of Ω .

Definition

 $C_0^{\infty}(\Omega)$ is the set of all functions that are infinitely differentiable on Ω and compactly supported in Ω .

Recall integration by parts:

$$\int_{\Omega} \frac{\partial u}{\partial x} v \ dxdy = \int_{\partial \Omega} uvn_x \ ds - \int_{\Omega} u \frac{\partial v}{\partial x} \ dxdy.$$

• For $v \in C_0^{\infty}(\Omega)$, we have v = 0 on $\partial\Omega$. Then

$$\int_{\Omega} \frac{\partial u}{\partial x} v \ dxdy = -\int_{\Omega} u \frac{\partial v}{\partial x} \ dxdy.$$

Definition (weak derivative with respect to x in 2D)

Suppose u is a real-valued function defined on a domain Ω and that u is integrable over every compact subset of Ω . If there exists another locally integrable function w defined on Ω such that

$$\int_{\Omega} wv \ dxdy = -\int_{\Omega} u \frac{\partial v}{\partial x} \ dxdy.$$

for all $v \in C_0^{\infty}(\Omega)$, then u is said to be weakly differentiable with respect to x and w is called the weak partial derivative of u with respect to x.

Definition (general weak derivative in 2D)

Let $\alpha=(\alpha_1,\alpha_2)$. Suppose u is a real-valued function defined on a domain Ω and that u is integrable over every compact subset of Ω . If there exists another locally integrable function w defined on Ω such that

$$\int_{\Omega} wv \ dxdy = (-1)^{\alpha_1 + \alpha_2} \int_{\Omega} u \frac{\partial^{\alpha_1 + \alpha_2} v}{\partial x^{\alpha_1} \partial y^{\alpha_2}} \ dxdy.$$

for all $v \in C_0^{\infty}(\Omega)$, then u is said to be α weakly differentiable and w is called the weak partial derivative of order α of u.

Lemma (II)

If u is differentiable, then u is weakly differentiable and its weak derivative of order $\alpha = (\alpha_1, \alpha_2)$ is $\frac{\dot{\partial}^{\alpha_1 + \alpha_2} u}{\partial x^{\alpha_1} \partial v^{\alpha_2}}$.

Dirichlet boundary condition

Remark

In the Sobolev spaces, which will be defined below, $\frac{\partial^{\alpha_1+\alpha_2}u}{\partial x^{\alpha_1}\partial v^{\alpha_2}}$ is used to represent the weak derivative of order $\alpha = (\alpha_1, \alpha_2)$.

Definition (L^p space)

$$L^p(\Omega) = \{ v : \Omega \to \mathbf{R} : \int_{\Omega} v^p \, dx dy < \infty \}.$$

Dirichlet boundary condition

Definition (L^2 space)

$$L^2(\Omega) = \{ v : \Omega \to \mathbf{R} : \int_{\Omega} v^2 \, dx dy < \infty \}.$$

Definition (L^{∞} space)

$$L^{\infty}(\Omega) = \{v : \Omega \to \mathbf{R} : \sup_{(x,y) \in \Omega} |u(x,y)| < \infty\}.$$

Definition (H^m space)

$$H^{m}(\Omega) = \{ v \in L^{2}(\Omega) : \frac{\partial^{\alpha_{1}+\alpha_{2}}v}{\partial x^{\alpha_{1}}\partial y^{\alpha_{2}}} \in L^{2}(\Omega), \ \forall \alpha_{1}+\alpha_{2}=1,\cdots,m \}.$$

Definition (H^1 space)

$$H^{1}(\Omega) = \{ v \in L^{2}(\Omega) : \frac{\partial^{\alpha_{1} + \alpha_{2}} v}{\partial x^{\alpha_{1}} \partial v^{\alpha_{2}}} \in L^{2}(\Omega), \ \forall \alpha_{1} + \alpha_{2} = 1 \}.$$

Definition $(H_0^1 \text{ space})$

$$H_0^1(\Omega) = \{ v \in H^1(\Omega) : v = 0 \text{ on } \partial\Omega \}.$$

Definition (W_p^m space)

$$W_p^m(\Omega) = \{ v : \Omega \to \mathbf{R} : \int_{\Omega} \left[\frac{\partial^{\alpha_1 + \alpha_2} v}{\partial x^{\alpha_1} \partial y^{\alpha_2}} \right]^p dx dy < \infty,$$
$$\forall \alpha_1 + \alpha_2 = 0, \cdots, m \}.$$

Dirichlet boundary condition

Remark

- $L^p(\Omega) = W_p^0(\Omega)$;
- $L^{2}(\Omega) = W_{2}^{0}(\Omega)$;
- $H^m(\Omega) = W_2^m(\Omega)$;
- $H^1(\Omega) = W_2^1(\Omega)$.

Weak formulation

• Weak formulation: find $u \in H^1(\Omega)$ such that

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy = \int_{\Omega} f v \ dx dy.$$

for any $v \in H_0^1(\Omega)$.

- Let $a(u, v) = \int_{\Omega} c \nabla u \cdot \nabla v dx dy$ and $(f, v) = \int_{\Omega} f v dx dy$.
- Weak formulation: find $u \in H^1(\Omega)$ such that

$$a(u,v)=(f,v)$$

for any $v \in H_0^1(\Omega)$.

- Assume there is a finite dimensional subspace $U_h \subset H^1(\Omega)$. Define U_{h0} to be the space which consists of the functions of U_h with value 0 on the Dirichlet boundary.
- Then the Galerkin formulation is to find $u_h \in U_h$ such that

$$a(u_h, v_h) = (f, v_h)$$

$$\Leftrightarrow \int_{\Omega} c \nabla u_h \cdot \nabla v_h \ dxdy = \int_{\Omega} f v_h \ dxdy$$

for any $v_h \in U_{h0}$.

- Basic idea of Galerkin formulation: use finite dimensional space to approximate infinite dimensional space.
- Here $U_h = span\{\phi_j\}_{j=1}^{N_b}$ is chosen to be a finite element space where $\{\phi_j\}_{j=1}^{N_b}$ are the global finite element basis functions.

Galerkin formulation

 For an easier implementation, we use the following Galerkin formulation (without considering the Dirichlet boundary condition, which will be handled later): find $u_h \in U_h$ such that

$$a(u_h, v_h) = (f, v_h)$$

 $\Leftrightarrow \int_{\Omega} c \nabla u_h \cdot \nabla v_h \ dxdy = \int_{\Omega} f v_h \ dxdy$

for any $v_h \in U_h$.

FE Method

- Weak/Galerkin formulation
- 2 FE discretization
- Oirichlet boundary condition
- 4 FE Method
- More Discussion

Discretization formulation

Weak/Galerkin formulation

Recall the following definitions from Chapter 2:

- N: number of mesh elements.
- N_m : number of mesh nodes.
- E_n $(n = 1, \dots, N)$: mesh elements.
- Z_k ($k = 1, \dots, N_m$): mesh nodes.
- N_I : number of local mesh nodes in a mesh element.
- P:information matrix consisting of the coordinates of all mesh nodes.

Dirichlet boundary condition

• T: information matrix consisting of the global node indices of the mesh nodes of all the mesh elements.

Discretization formulation

- We only consider the nodal basis functions (Lagrange type) in this course.
- N_{lb} : number of local finite element nodes (=number of local finite element basis functions) in a mesh element.
- N_b : number of the finite element nodes (= the number of unknowns = the total number of the finite element basis functions).
- X_i $(j = 1, \dots, N_b)$: finite element nodes.
- Ph: information matrix consisting of the coordinates of all finite element nodes.
- T_b: information matrix consisting of the global node indices of the finite element nodes of all the mesh elements.

• Recall the Galerkin formulation: find $u_h \in U_h$ such that

$$a(u_h, v_h) = (f, v_h)$$

$$\Leftrightarrow \int_{\Omega} c \nabla u_h \cdot \nabla v_h \ dxdy = \int_{\Omega} f v_h \ dxdy$$

for any $v_h \in U_h$.

- Here $U_h = span\{\phi_j\}_{j=1}^{N_b}$ is chosen to be a finite element space where $\{\phi_j\}_{j=1}^{N_b}$ are the global finite element basis functions defined in Chapter 2.
- Since $u_h \in U_h = span\{\phi_i\}_{i=1}^{N_b}$, then

$$u_h = \sum_{j=1}^{N_b} u_j \phi_j$$

for some coefficients u_j $(j=1,\cdots,N_b)$.

Discretization formulation

In fact, since

$$\phi_j(X_k) = \delta_{jk} = \begin{cases} 0, & \text{if } j \neq k, \\ 1, & \text{if } j = k. \end{cases}$$

then

$$u_h(X_k) = \sum_{j=1}^{N_b} u_j \phi_j(A_k) = u_k.$$

Dirichlet boundary condition

 Hence the coefficient u_i is actually the numerical solution at the node X_i $(j = 1, \dots, N_b)$.

Discretization formulation

- If we can set up a linear algebraic system for u_i $(j = 1, \dots, N_b)$ and solve it, then we can obtain the finite element solution u_h.
- Therefore, we choose the test function $v_h = \phi_i \ (i = 1, \dots, N_b)$. Then the finite element formulation gives

$$\begin{split} &\int_{\Omega} c \nabla \left(\sum_{j=1}^{N_b} u_j \phi_j \right) \cdot \nabla \phi_i \ dxdy = \int_{\Omega} f \phi_i \ dxdy, \\ \Rightarrow & \sum_{i=1}^{N_b} u_j \left[\int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \ dxdy \right] = \int_{\Omega} f \phi_i \ dxdy, \ i = 1, \cdots, N_b. \end{split}$$

Matrix formulation

Define the stiffness matrix

$$A = [a_{ij}]_{i,j=1}^{N_b} = \left[\int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right]_{i,j=1}^{N_b}.$$

Define the load vector

$$\vec{b} = [b_i]_{i=1}^{N_b} = \left[\int_{\Omega} f \phi_i \, dx dy \right]_{i=1}^{N_b}.$$

Define the unknown vector

$$\vec{X} = [u_j]_{j=1}^{N_b}.$$

• Then we obtain the linear algebraic system

$$A\vec{X} = \vec{b}$$
.

- Once \vec{X} is obtained, the finite element solution u_h and the numerical solutions at all the mesh nodes are obtained.
- From the definition of ϕ_j $(j=1,\cdots,N_b)$, we can see that ϕ_j are non-zero only on the elements adjacent to the node X_j , but 0 on all the other elements.
- This observation motivates us to think about

$$a_{ij} = \int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dxdy = \sum_{n=1}^{N} \int_{E_n} c \nabla \phi_j \cdot \nabla \phi_i \, dxdy.$$

- It is easy to see that most of $\int_{E_n} c \nabla \phi_j \cdot \nabla \phi_i \ dxdy$ will be 0.
- So we only need to use numerical integration to compute those nonzero integrals.

General local assembly idea for A:

- Loop over all the elements;
- Compute all non-zero local integrals on each element for A;
- Assemble these non-zero local integrals into the corresponding entries of the stiffness matrix A.

Compute all non-zero local integrals on each element for A:

- On the n^{th} element E_n , we get non-zero local integrals only when the trial and test basis functions are corresponding to the finite element nodes of this element.
- Let $p_s = T_h(s, n)$ $(s = 1, \dots, N_{lh})$.
- Then we only consider the trial and test basis functions to be ϕ_{p_s} $(s=1,\cdots,N_{lb}).$
- There are only N_{lh}^2 non-zero local integrals on E_n with the global basis functions ϕ_{p_s} ($s=1,\cdots,N_{lb}$):

$$\int_{E_n} c \nabla \phi_j \cdot \nabla \phi_i \, dxdy \, (i,j=p_1,\cdots,p_{N_{lb}}).$$

In fact, we have

$$\psi_{ns} = \phi_{p_s}|_{E_n} \ (s=1,\cdots,N_{lb}).$$

• That is, instead of the original non-zero local integrals with the global basis functions ϕ_{P_s} $(s=1,\cdots,N_{lb})$, we will compute the following non-zero local integrals with the local basis functions ψ_{ns} $(s=1,\cdots,N_{lb})$:

Dirichlet boundary condition

$$\int_{E_n} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} \, dxdy \, (\alpha, \beta = 1, \cdots, N_{lb}).$$

- Question: how to compute these integrals?
- Gauss quadrature. The needed information is stored in the matrices P and T.

Assemble the non-zero local integrals into A:

- When the trial function is ϕ_i and the test function is ϕ_j , the corresponding non-zero local integrals should be assembled to a_{ij} .
- Therefore, if we find the global node indices of the trial and test basis functions, we can easily locate where to assemble a non-zero local integral.

Question: Since we compute

$$\int_{E_n} c
abla \psi_{nlpha} \cdot
abla \psi_{neta} \, \, dxdy \, \, (lpha,eta=1,\cdots, extstyle N_{lb})$$

Dirichlet boundary condition

instead of

$$\int_{E_n} c \nabla \phi_j \cdot \nabla \phi_i \, dxdy \, (i,j=p_1,\cdots,p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local trial and test basis functions $\psi_{n\alpha}$ and $\psi_{n\beta}$ $(\alpha, \beta = 1, \cdots, N_{lb})$?

Information matrix T_h!

• Recall that $T_b(\alpha, n)$ and $T_b(\beta, n)$ give the global node indices of the local trial and test basis functions $\psi_{n\alpha}$ and $\psi_{n\beta}$ $(\alpha, \beta = 1, \dots, N_{lb})$.

Dirichlet boundary condition

• That is, for $n = 1, \dots, N$,

$$\int_{E_n} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} \, dxdy \, (\alpha, \beta = 1, \cdots, N_{lb})$$

should be assembled to a_{ij} where $i = T_b(\beta, n)$ and $j = T_b(\alpha, n)$.

Algorithm I-1:

- Initialize the matrix: $A = sparse(N_b, N_b)$;
- Compute the integrals and assemble them into A:

```
FOR n=1,\cdots,N:

FOR \alpha=1,\cdots,N_{lb}:

FOR \beta=1,\cdots,N_{lb}:

Compute r=\int_{E_n}c\nabla\psi_{n\alpha}\cdot\nabla\psi_{n\beta}\;dxdy;

Add r to A(T_b(\beta,n),T_b(\alpha,n)).

END

END

FND
```

Algorithm I-2:

- Initialize the matrix: $A = sparse(N_b, N_b)$ and $S = zeros(N_{lb}, N_{lb})$;
- Compute the integrals and assemble them into A:

```
FOR n = 1, \dots, N:
      FOR \alpha = 1, \dots, N_{lb}:
             FOR \beta = 1, \cdots, N_{lb}:
                   Compute S(\beta, \alpha) = \int_{F_{-}} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} dxdy;
             END
      END
      A(T_b(:,n),T_b(:,n))=A(T_b(:,n),T_b(:,n))+S;
FND
```

To make a general subroutine for different cases, more information needed for computing and assembling the integral should be treated as input parameters or input functions of this subroutine:

- the coefficient function c:
- the quadrature points and weights for numerical integrals;
- the mesh information matrices P and T, which can also provide the number of mesh elements N = size(T, 2) and the number of mesh nodes $N_m = size(P, 2)$;
- the finite element information matrices P_b and T_b for the trial and test functions respectively, which can also provide the number of local basis functions $N_{lb} = size(T_b, 1)$ and the number of the global basis functions $N_b = size(P_b, 2)$ (= the number of unknowns);
- the type of the basis function for the trial and test functions respectively: 4 D > 4 B > 4 B > 4 B > B = 900

Note that

$$\int_{E_n} c \nabla \psi_{n\alpha} \cdot \nabla \psi_{n\beta} \ dxdy = \int_{E_n} c \frac{\partial \psi_{n\alpha}}{\partial x} \frac{\partial \psi_{n\beta}}{\partial x} \ dxdy + \int_{E_n} c \frac{\partial \psi_{n\alpha}}{\partial y} \frac{\partial \psi_{n\beta}}{\partial y} \ dxdy.$$

Dirichlet boundary condition

 Hence we can consider to develop an algorithm to assemble the matrix arising from a more general integral

$$\int_{F_n} c \frac{\partial^{r+s} \psi_{n\alpha}}{\partial x^r \partial y^s} \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} dx dy.$$

with parameters r, s, p, and q.

Assembly of the stiffness matrix

Algorithm I-3:

- Initialize the matrix: $A = sparse(N_b, N_b)$;
- Compute the integrals and assemble them into A:

```
FOR n = 1, \dots, N:
         FOR \alpha = 1, \dots, N_{lb}:
                  FOR \beta = 1, \dots, N_{lb}:
                           Compute r = \int_{E_n} c \frac{\partial^{r+s} \psi_{n\alpha}}{\partial x^r \partial y^s} \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} dxdy;
                           Add r to A(T_b(\beta, n), T_b(\alpha, n)).
                   END
         END
FND
```

Assembly of the stiffness matrix

Algorithm I-4:

- Initialize the matrix: $A = sparse(N_b, N_b)$ and $S = zeros(N_{lb}, N_{lb})$;
- Compute the integrals and assemble them into A:

```
\begin{aligned} \textit{FOR } & \textit{n} = 1, \cdots, \textit{N}: \\ & \textit{FOR } \alpha = 1, \cdots, \textit{N}_{lb}: \\ & \textit{FOR } \beta = 1, \cdots, \textit{N}_{lb}: \\ & \textit{Compute } S(\beta, \alpha) = \int_{E_n} c \frac{\partial^{r+s} \psi_{n\alpha}}{\partial x^r \partial y^s} \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} \ \textit{dxdy}; \\ & \textit{END} \\ & \textit{END} \\ & \textit{A}(T_b(:, \textit{n}), T_b(:, \textit{n})) = \textit{A}(T_b(:, \textit{n}), T_b(:, \textit{n})) + \textit{S}; \\ & \textit{END} \end{aligned}
```

Assembly of the stiffness matrix

• First, we call Algorithm I-3 with r = p = 1 and s = q = 0 to obtain A1.

Dirichlet boundary condition

- Second, we call Algorithm I-3 with r = p = 0 and s = q = 1 to obtain A2.
- Then the stiffness matrix A = A1 + A2.
- That is, Algorithm I-1 is equivalent to calling Algorithm I-3 twice with two different groups of parameters (r = p = 1, s = q = 0 and r = p = 0, s = q = 1) and then adding the two resulted matrices together.
- Algorithm I-2 and Algorithm I-4 have a similar relationship.

Weak/Galerkin formulation

 The idea for the assembly of the load vector is similar. We have

$$b_i = \int_{\Omega} f \phi_i \, dxdy = \sum_{n=1}^{N} \int_{E_n} f \phi_i \, dxdy, \ i = 1, \cdots, N_b.$$

Dirichlet boundary condition

- Loop over all the elements;
- Compute all non-zero local integrals on each element for the load vector \vec{b} ;
- Assemble these non-zero local integrals into the corresponding entries of the load vector \vec{b} .

Compute all non-zero local integrals on each element for \vec{b} :

- On the n^{th} element E_n , we get non-zero local integrals only when the test basis functions are corresponding to the finite element nodes of the element.
- Let $p_s = T_b(s, n)$ $(s = 1, \dots, N_{lb})$.
- Then we only consider the test basis functions to be ϕ_{p_s} ($s=1,\cdots,N_{lb}$).
- There are only N_{lb} non-zero local integrals on E_n with the global basis functions ϕ_{p_s} $(s=1,\cdots,N_{lb})$:

$$\int_{E_n} f \phi_i \, dxdy \, (i = p_1, \cdots, p_{N_{lb}}).$$

In fact, we have

$$\psi_{ns} = \phi_{p_s}|_{E_n} \ (s = 1, \cdots, N_{lb}).$$

Weak/Galerkin formulation

 That is, instead of the original non-zero local integrals with the global basis functions ϕ_{p_s} $(s=1,\cdots,N_{lb})$, we will compute the following non-zero local integrals with the local basis functions ψ_{ns} $(s = 1, \dots, N_{lb})$:

Dirichlet boundary condition

$$\int_{E_n} f \psi_{n\beta} \, dx dy \, (\beta = 1, \cdots, N_{lb}).$$

- Question: how to compute these integrals?
- Gauss quadrature. The needed information is stored in the matrices P and T.

Assemble the non-zero local integrals into \vec{b} :

- When the test function is ϕ_i , the corresponding non-zero local integrals should be assembled to b_i .
- Therefore, if we find the global node indices of the test basis functions, we can easily locate where to assemble a non-zero local integral.
- Question: Since we compute

$$\int_{E_n} f \psi_{n\beta} \, dxdy \, (\beta = 1, \cdots, N_{lb})$$

instead of

$$\int_{F_{a}} f \phi_{i} \, dxdy \, (i = p_{1}, \cdots, p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local test basis functions $\psi_{n\beta}$ ($\beta = 1, \dots, N_{lb}$)?

Information matrix T_b!

• Recall that $T_b(\beta, n)$ give the global node indices of the local test basis functions $\psi_{n\beta}$ ($\beta = 1, \dots, N_{lb}$).

Dirichlet boundary condition

• That is, for $n = 1, \dots, N$,

$$\int_{E_n} f \psi_{n\beta} \, dxdy \, (\beta = 1, \cdots, N_{lb})$$

should be assembled to b_i where $i = T_b(\beta, n)$.

Algorithm II-1:

- Initialize the matrix: $b = sparse(N_b, 1)$;
- Compute the integrals and assemble them into b:

```
FOR n = 1, \dots, N:
      FOR \beta = 1, \dots, N_{lb}:
            Compute r = \int_{F_n} f \psi_{n\beta} dxdy;
            b(T_b(\beta, n), 1) = b(T_b(\beta, n), 1) + r;
      END
END
```

Algorithm II-2:

- Initialize the vector: $b = sparse(N_b, 1)$ and $d = zeros(N_{lb}, 1)$;
- Compute the integrals and assemble them into b:

```
FOR n = 1, \dots, N:
       FOR \beta = 1, \dots, N_{lb}:
               Compute d(\beta,1) = \int_{E_{\sigma}} f \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} dxdy;
       END
       b(T_b(:,n),1) = b(T_b(:,n),1) + d;
FND
```

To make a general subroutine for different cases, more information needed for computing and assembling the integral should be treated as input parameters or input functions of this subroutine:

- the right hand side function f;
- the quadrature points and weights for numerical integrals;
- the mesh information matrices P and T, which can also provide the number of mesh elements N = size(T, 2) and the number of mesh nodes $N_m = size(P, 2)$;
- the finite element information matrices P_b and T_b for the test functions, which can also provide the number of local basis functions $N_{lb} = size(T_b, 1)$ and the number of the global basis functions $N_b = size(P_b, 2)$ (= the number of unknowns);
- the type of the basis function for the test functions.

 We can also consider to develop an algorithm to assemble the vector arising from

$$\int_{E_n} f \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} \ dx dy.$$

Algorithm II-3:

- Initialize the matrix: $b = sparse(N_b, 1)$;
- Compute the integrals and assemble them into b:

Dirichlet boundary condition

```
FOR n = 1, \dots, N:
       FOR \beta = 1, \cdots, N_{lb}:
               Compute r = \int_{E_n} f \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} dxdy;
               b(T_b(\beta, n), 1) = b(T_b(\beta, n), 1) + r;
       END
END
```

Algorithm II-4:

- Initialize the vector: $b = sparse(N_b, 1)$ and $d = zeros(N_{lb}, 1)$;
- Compute the integrals and assemble them into *b*:

```
 \begin{split} \textit{FOR } & n = 1, \cdots, \textit{N} \text{:} \\ & \textit{FOR } \beta = 1, \cdots, \textit{N}_{\textit{lb}} \text{:} \\ & \text{Compute } d(\beta, 1) = \int_{\textit{E}_n} f \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} \ dxdy; \\ & \textit{END} \\ & b(T_b(:, n), 1) = b(T_b(:, n), 1) + d; \\ & \textit{FND} \end{split}
```

- We call Algorithm I-3 with p = q = 0 to obtain b.
- That is, Algorithm II-3 is equivalent to Algorithm II-1 with p = a = 0.

Dirichlet boundary condition

Algorithm II-2 and Algorithm II-4 have a similar relationship.

FE Method

Outline

- Weak/Galerkin formulation
- Oirichlet boundary condition

Dirichlet boundary condition

- Basically, the Dirichlet boundary condition u = g give the solutions at all boundary finite element nodes.
- Since the coefficient u_i in the finite element solution $u_h = \sum_{i=1}^{N_b} u_i \phi_i$ is actually the numerical solution at the finite element node X_i $(j = 1, \dots, N_b)$, we actually know those u_i which are corresponding to the boundary finite element nodes.
- Recall that boundarynodes(2,:) store the global node indices of all boundary finite element nodes.
- If $m \in boundarynodes(2,:)$, then the m^{th} equation is called a boundary node equation.
- Set *nbn* to be the number of boundary nodes:

Weak/Galerkin formulation

 One way to impose the Dirichlet boundary condition is to replace the boundary node equations in the linear system by the following equations

$$u_m = g(X_m).$$

Dirichlet boundary condition

for all $m \in boundary nodes(2, :)$.

Dirichlet boundary condition

Algorithm III:

Deal with the Dirichlet boundary conditions:

```
FOR k = 1, \dots, nbn:
    If boundarynodes(1, k) shows Dirichlet condition, then
         i = boundary nodes(2, k);
         A(i,:) = 0;
         A(i, i) = 1;
         b(i) = g(P_b(:,i));
    ENDIF
END
```

Outline

- Weak/Galerkin formulation
- 2 FE discretization
- 3 Dirichlet boundary condition
- 4 FE Method
- More Discussion

Universal framework of the finite element method

- Generate the mesh information: matrices *P* and *T*;
- Assemble the matrices and vectors: local assembly based on P and T only;
- Deal with the boundary conditions: boundary information matrix and local assembly;
- Solve linear systems: numerical linear algebra.

Weak/Galerkin formulation

- Generate the mesh information matrices P and T.
- Assemble the stiffness matrix A by using Algorithm I. (We will choose Algorithm I-3 in class)
- Assemble the load vector \vec{b} by using Algorithm II. (We will choose Algorithm II-3 in class)
- Deal with the Drichlet boundary condition by using Algorithm III.
- Solve $A\vec{X} = \vec{b}$ for \vec{X} by using a direct or iterative method.

Algorithm

Recall Algorithm I-3:

- Initialize the matrix: $A = sparse(N_b, N_b)$;
- Compute the integrals and assemble them into A:

```
\begin{aligned} \textit{FOR } & n = 1, \cdots, N: \\ & \textit{FOR } \alpha = 1, \cdots, N_{lb}: \\ & \textit{FOR } \beta = 1, \cdots, N_{lb}: \\ & \text{Compute } r = \int_{E_n} c \frac{\partial^{r+s} \psi_{n\alpha}}{\partial x^r \partial y^s} \frac{\partial^{p+q} \psi_{n\beta}}{\partial x^p \partial y^q} \ dxdy; \\ & \text{Add } r \text{ to } A(T_b(\beta, n), T_b(\alpha, n)). \\ & \textit{END} \\ & \textit{END} \\ & \textit{END} \\ & \textit{END} \end{aligned}
```

Algorithm

Recall

• First, we call Algorithm I-3 with r = p = 1 and s = q = 0 to obtain A1.

Dirichlet boundary condition

- Second, we call Algorithm I-3 with r = p = 0 and s = q = 1to obtain A2.
- Then the stiffness matrix A = A1 + A2.

Recall Algorithm II-3:

- Initialize the matrix: $b = sparse(N_b, 1)$;
- Compute the integrals and assemble them into *b*:

```
FOR n = 1, \dots, N:

FOR \beta = 1, \dots, N_{lb}:

Compute r = \int_{E_n} f \frac{\partial^{\rho+q} \psi_{n\beta}}{\partial x^{\rho} \partial y^{q}} dxdy;

b(T_b(\beta, n), 1) = b(T_b(\beta, n), 1) + r;

END
```

END

• Recall: We call Algorithm I-3 with p = q = 0 to obtain b.

Recall Algorithm III:

• Deal with the Dirichlet boundary conditions:

```
FOR k=1,\cdots,nbn:

If boundarynodes(1,k) shows Dirichlet condition, then i=boundarynodes(2,k);

A(i,:)=0;

A(i,i)=1;
b(i)=g(P_b(:,i));

ENDIF
```

Recall

Weak/Galerkin formulation

Definition (L^2 space)

$$L^2(\Omega) = \{ v : \Omega \to \mathbf{R} : \int_{\Omega} v^2 \, dx dy < \infty \}.$$

Dirichlet boundary condition

Definition (H^1 space)

$$H^{1}(\Omega) = \{ v \in L^{2}(\Omega) : \frac{\partial^{\alpha_{1} + \alpha_{2}} v}{\partial x^{\alpha_{1}} \partial v^{\alpha_{2}}} \in L^{2}(\Omega), \ \forall \alpha_{1} + \alpha_{2} = 1 \}.$$

Definition (L^{∞} space)

$$L^{\infty}(\Omega) = \{ v : \Omega \to \mathbf{R} : \sup_{(x,y) \in \Omega} |u(x,y)| < \infty \}.$$

- L^{∞} norm: $\|u\|_{\infty} = \sup_{(x,y)\in\Omega} |u(x,y)|$ for $u \in L^{\infty}(\Omega)$.
- L^{∞} norm error: $\|u-u_h\|_{\infty} = \sup_{(x,y)\in\Omega} |u(x,y)-u_h(x,y)|.$
- L^2 norm: $||u||_0 = \sqrt{\int_{\Omega} u^2 dx dy}$ for $u \in L^2(\Omega)$.
- L^2 norm error: $\|u-u_h\|_0 = \sqrt{\int_\Omega (u-u_h)^2 dx dy}$.
- H^1 semi-norm: $|u|_1 = \sqrt{\int_{\Omega} \left(\frac{\partial u}{\partial x}\right)^2 dx dy} + \int_{\Omega} \left(\frac{\partial u}{\partial y}\right)^2 dx dy$ for $u \in H^1(\Omega)$.
- H¹ semi-norm error:

$$|u-u_h|_1 = \sqrt{\int_{\Omega} \left(\frac{\partial (u-u_h)}{\partial x}\right)^2 dx dy + \int_{\Omega} \left(\frac{\partial (u-u_h)}{\partial y}\right)^2 dx dy}.$$

• By using $u_h = \sum_{j=1}^{N_b} u_j \phi_j$, the definition of T_b , and the definition of the local basis functions ψ_{nk} , we get

$$\begin{aligned} \|u - u_h\|_{\infty} &= \sup_{(x,y) \in \Omega} |u(x,y) - u_h(x,y)| \\ &= \max_{1 \le n \le N} \max_{(x,y) \in E_n} |u(x,y) - u_h(x,y)| \\ &= \max_{1 \le n \le N} \max_{(x,y) \in E_n} \left| u(x,y) - \sum_{j=1}^{N_b} u_j \phi_j \right| \\ &= \max_{1 \le n \le N} \max_{(x,y) \in E_n} \left| u(x,y) - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \psi_{nk}(x,y) \right|. \end{aligned}$$

Define

$$w_n(x,y) = \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \psi_{nk}(x,y).$$

Then

$$\|u-u_h\|_{\infty} = \max_{1 \leq n \leq N} \max_{(x,y) \in E_n} |u(x,y)-w_n(x,y)|.$$

 $\max_{(x,y)\in E_n} |u(x,y)-w_n(x,y)|$ can be approximated by choosing the maximum values of $|u(x,y)-w_n(x,y)|$ on a group of chosen points in E_n , such as some Gauss quadrature nodes in this element. We denote the approximation by r_n .

Algorithm IV:

- Initialize the error error = 0:
- Approximate the maximum absolute errors on all elements and then choose the largest one as the final approximation:

```
FOR n = 1, \dots, N:
     Compute r_n \approx \max_{(x,y) \in E_n} |u(x,y) - w_n(x,y)|;
     IF r_n > error, THEN
           error = r_n;
     END
FND
```

• By using $u_h = \sum_{i=1}^{N_b} u_j \phi_j$, the definition of T_b , and the definition of the local basis functions ψ_{nk} , we get

$$||u - u_h||_0 = \sqrt{\int_{\Omega} (u - u_h)^2 dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} (u - u_h)^2 dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} \left(u - \sum_{j=1}^{N_b} u_j \phi_j \right)^2 dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} \left(u - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \psi_{nk} \right)^2 dx dy}.$$

Define

$$w_n = \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \psi_{nk}.$$

Dirichlet boundary condition

Then

$$\|u-u_h\|_0 = \sqrt{\sum_{n=1}^N \int_{E_n} (u-w_n)^2 dx dy}.$$

• Each integral $\int_{E_n} (u - w_n)^2 dx dy$ can be computed by numerical integration.

• By using $u_h = \sum_{j=1}^{N_b} u_j \phi_j$, the definition of T_b , and the definition of the local basis functions ψ_{nk} , we get

$$|u - u_{h}|_{1,x} = \sqrt{\int_{\Omega} \left(\frac{\partial(u - u_{h})}{\partial x}\right)^{2}}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} \left(\frac{\partial(u - u_{h})}{\partial x}\right)^{2} dxdy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} \left(\frac{\partial u}{\partial x} - \sum_{j=1}^{N_{b}} u_{j} \frac{\partial \phi_{j}}{\partial x}\right)^{2} dxdy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_{n}} \left(\frac{\partial u}{\partial x} - \sum_{k=1}^{N_{b}} u_{T_{b}(k,n)} \frac{\partial \psi_{nk}}{\partial x}\right)^{2} dxdy}.$$

Similarly,

$$|u - u_h|_{1,y} = \sqrt{\int_{\Omega} \left(\frac{\partial (u - u_h)}{\partial y}\right)^2 dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial (u - u_h)}{\partial y}\right)^2 dx dy}$$

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial u}{\partial y} - \sum_{j=1}^{N_b} u_j \frac{\partial \phi_j}{\partial y}\right)^2 dx dy}$$

$$= \sqrt{\left(\frac{\partial u}{\partial y} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial y}\right)^2 dx dy}.$$

Then

$$\begin{aligned} &|u-u_h|_{1,x}^2 \\ &= |u-u_h|_{1,x}^2 + |u-u_h|_{1,y}^2 \\ &= \sum_{n=1}^N \int_{E_n} \left(\frac{\partial u}{\partial x} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial x} \right)^2 dx dy \\ &+ \sum_{n=1}^N \int_{E_n} \left(\frac{\partial u}{\partial y} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial y} \right)^2 dx dy. \end{aligned}$$

FE Method

Measurements for errors

Define

$$w_{n1} = \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial x},$$

$$w_{n2} = \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial \psi_{nk}}{\partial y}.$$

Then

$$= \sqrt{\sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial u}{\partial x} - w_{n1}\right)^2 dx dy} + \sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial u}{\partial y} - w_{n2}\right)^2 dx dy.$$

• Each integral $\int_{E_n} \left(\frac{\partial u}{\partial x} - w_{n1} \right)^2 dxdy$ or $\int_{E_n} \left(\frac{\partial u}{\partial y} - w_{n2} \right)^2 dxdy$ can be computed by numerical integration.

Measurements for errors

Develop a subroutine for a more general formulation

$$\sqrt{\sum_{n=1}^{N} \int_{E_n} \left(\frac{\partial^{\alpha_1 + \alpha_2} u}{\partial x^{\alpha_1} \partial y^{\alpha_2}} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial^{\alpha_1 + \alpha_2} \psi_{nk}}{\partial x^{\alpha_1} \partial y^{\alpha_2}} \right)^2 dx dy}.$$

- $\|u-u_h\|_0$ is equivalent to calling this subroutine with $\alpha_1=0$ and $\alpha_2 = 0$.
- $ullet |u-u_h|_{1,x}$ is equivalent to calling this subroutine with $lpha_1=1$ and $\alpha_2 = 0$.
- $|u u_h|_{1,y}$ is equivalent to calling this subroutine with $\alpha_1 = 0$ and $\alpha_2 = 1$.

Measurements for errors

Algorithm V:

- Initialize the error error = 0; input the parameters α_1 and α_2 ;
- Compute the integrals and add them into the total error:

FOR
$$n = 1, \dots, N$$
:

$$error = error + \int_{E_n} \left(\frac{\partial^{\alpha_1 + \alpha_2} u}{\partial x^{\alpha_1} \partial y^{\alpha_2}} - \sum_{k=1}^{N_{lb}} u_{T_b(k,n)} \frac{\partial^{\alpha_1 + \alpha_2} \psi_{nk}}{\partial x^{\alpha_1} \partial y^{\alpha_2}} \right)^2 dx dy;$$

END
$$error = \sqrt{error}$$
;

Numerical example

• Example 1: Use the finite element method to solve the following equation on the domain $\Omega = [-1, 1] \times [-1, 1]$:

$$-\nabla \cdot (\nabla u) = -y(1-y)(1-x-\frac{x^2}{2})e^{x+y}$$

$$-x(1-\frac{x}{2})(-3y-y^2)e^{x+y},$$

$$u = -1.5y(1-y)e^{-1+y} \text{ on } x = -1,$$

$$u = 0.5y(1-y)e^{1+y} \text{ on } x = 1,$$

$$u = -2x(1-\frac{x}{2})e^{x-1} \text{ on } y = -1,$$

$$u = 0 \text{ on } y = 1.$$

• The analytic solution of this problem is $u = xy(1 - \frac{x}{2})(1 - y)e^{x+y}$, which can be used to compute the error of the numerical solution.

Numerical example

- Let's code for the linear and quadratic finite element method of the 2D second order elliptic equation together!
- Open your Matlab!

- Weak/Galerkin formulation
- 2 FE discretization
- 3 Dirichlet boundary condition
- 4 FE Method
- More Discussion

Consider

$$-\nabla \cdot (c\nabla u) = f \ \text{ in } \Omega, \ \nabla u \cdot \vec{n} = p \ \text{ on } \partial \Omega.$$

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy - \int_{\partial \Omega} (c \nabla u \cdot \vec{n}) \, v \, ds = \int_{\Omega} f v \, dx dy.$$

Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy = \int_{\Omega} f v \, dx dy + \int_{\partial \Omega} c p v \, ds.$$

- Is there anything wrong? The solution is not unique!
- If u is a solution, then u + c is also a solution where c is a constant.

Consider

$$-\nabla \cdot (c\nabla u) = f \text{ in } \Omega,$$

$$\nabla u \cdot \vec{n} = p \text{ on } \Gamma_N \subset \partial \Omega,$$

$$u = g \text{ on } \partial \Omega / \Gamma_N.$$

Dirichlet boundary condition

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy - \int_{\partial \Omega} \left(c \nabla u \cdot \vec{n} \right) v \ ds = \int_{\Omega} f v \ dx dy.$$

• Since the solution on $\partial \Omega/\Gamma_N$ is given by u=g, then we can choose the test function v(x) such that v=0 on $\partial\Omega/\Gamma_N$.

Since

$$\int_{\partial\Omega} (c\nabla u \cdot \vec{n}) v \, ds = \int_{\Gamma_N} (c\nabla u \cdot \vec{n}) v \, ds + \int_{\partial\Omega/\Gamma_N} (c\nabla u \cdot \vec{n}) v \, ds$$

$$= \int_{\Gamma_N} cpv \, ds,$$

then

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy - \int_{\Gamma_N} c p v \ ds = \int_{\Omega} f v \ dx dy.$$

Hence the weak formulation is

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dxdy = \int_{\Omega} fv \, dxdy + \int_{\Gamma} cpv \, ds.$$

Weak/Galerkin formulation

• Then the Galerkin formulation is to find $u_h \in U_h$ such that

Dirichlet boundary condition

$$\int_{\Omega} c \nabla u_h \cdot \nabla v_h \, dxdy = \int_{\Omega} f v_h \, dxdy + \int_{\Gamma_N} c p v_h \, ds$$

for any $v_h \in U_h$.

• Recall: Since $u_h \in U_h = span\{\phi_i\}_{i=1}^{N_b}$, then

$$u_h = \sum_{j=1}^{N_b} u_j \phi_j$$

for some coefficients u_i $(j = 1, \dots, N_b)$.

• Recall: Choose $v_h = \phi_i$ $(i = 1, \dots, N_b)$.

• Then for $i = 1, \dots, N_b$, the finite element formulation gives

$$\begin{split} &\int_{\Omega} c \nabla (\sum_{j=1}^{N_b} u_j \phi_j) \cdot \nabla \phi_i \ dx dy = \int_{\Omega} f \phi_i \ dx dy + \int_{\Gamma_N} c p \phi_i \ ds, \\ \Rightarrow & \sum_{i=1}^{N_b} u_j \left[\int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \ dx dy \right] = \int_{\Omega} f \phi_i \ dx dy + \int_{\Gamma_N} c p \phi_i \ ds. \end{split}$$

Recall

Define the stiffness matrix

$$A = [a_{ij}]_{i,j=1}^{N_b} = \left[\int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right]_{i,j=1}^{N_b}.$$

Dirichlet boundary condition

Define the load vector

$$\vec{b} = [b_i]_{i=1}^{N_b} = \left[\int_{\Omega} f \phi_i \, dx dy\right]_{i=1}^{N_b}.$$

Define the unknown vector

$$\vec{X} = [u_j]_{j=1}^{N_b}.$$

More Discussion

- Define the additional vector from the Neumann beyondow

Define the additional vector from the Neumann boundary condition

$$\vec{v} = [v_i]_{i=1}^{N_b} = \left[\int_{\Gamma_N} cp\phi_i \ ds\right]_{i=1}^{N_b}.$$

- Define the new vector $\vec{\vec{b}} = \vec{b} + \vec{v}$.
- Then we obtain the linear algebraic system

$$A\vec{X} = \widetilde{\vec{b}}.$$

- Code?
- Add one more subroutine for \vec{v} to the existing code!

Recall

- Matrix boundaryedges:
- boundaryedges(1, k) is the type of the k^{th} boundary edge e_k : Dirichlet (-1), Neumann (-2), Robin (-3).....
- boundaryedges(2, k) is the index of the element which contains the k^{th} boundary edge e_k .
- Each boundary edge has two end nodes. We index them as the first and the second counterclock wise along the boundary.
- boundaryedges(3, k) is the global node index of the first end node of the k^{th} boundary boundary edge e_k .
- boundaryedges(4, k) is the global node index of the second end node of the k^{th} boundary boundary edge e_k .
- Set nbe = size(boundaryedges, 2) to be the number of boundary edges; 4 D > 4 D > 4 B > 4 B > B

• The idea for the assembly of the vector \vec{v} is similar to that of the load vector. We have

Dirichlet boundary condition

$$v_i = \int_{\Gamma_N} cp\phi_i \ ds = \sum_{\substack{e_k \subset \Gamma_N \\ 1 \leq k \leq nbe}} \int_{e_k} cp\phi_i \ ds, \ i = 1, \cdots, N_b.$$

- Loop over all the boundary edges;
- Compute all non-zero local integrals on each Neumann boundary edge for the vector \vec{v} ;
- Assemble these non-zero local integrals into the corresponding entries of the vector \vec{v} .

Compute all non-zero local integrals on each Neumann boundary edge for \vec{v} :

- The index of the element which contains the k^{th} boundary edge e_k is $n_k = boundaryedges(2, k)$. Then on e_k , we get non-zero local integrals only when the test basis functions are corresponding to the finite element nodes of the n_k^{th} element E_{n_k} .
- Let $p_s = T_b(s, n_k)$ $(s = 1, \dots, N_{lb})$.
- Then we only consider the test basis functions to be ϕ_{p_s} ($s=1,\cdots,N_{lb}$).
- There are only N_{lb} non-zero local integrals on e_k with the global basis functions ϕ_{P_s} $(s=1,\cdots,N_{lb})$:

$$\int_{e_{l}} cp\phi_{i} \ ds \ (i=p_{1},\cdots,p_{N_{lb}}).$$

In fact, we have

$$\psi_{n_ks}=\phi_{p_s}|_{E_{n_k}} \ (s=1,\cdots,N_{lb}).$$

Dirichlet boundary condition

• That is, instead of the original non-zero local integrals with the global basis functions ϕ_{p_s} ($s=1,\cdots,N_{lb}$), we will compute the following non-zero local integrals with the local basis functions $\psi_{n_k s}$ ($s=1,\cdots,N_{lb}$):

$$\int_{e_k} cp\psi_{n_k\beta} \ ds \ (\beta=1,\cdots,N_{lb}).$$

- Question: how to compute these integrals?
- Gauss quadrature. The needed information is stored in the matrices *P* and *boundaryedges*.

Weak/Galerkin formulation

• P(:, boundaryedges(3:4, k)) provides the coordinates of the two end points of the k^{th} boundary edge. We discuss three cases based on these coordinates.

Dirichlet boundary condition

• Case 1: If a boundary edge is vertical, then it can be described as x = c ($y_1 \le y \le y_2$). The y-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss quadrature on $[y_1, y_2]$. And the x-coordinates of the Gauss quadrature nodes are fixed to be c.

- Case 2: If a boundary edge is horizontal, then it can be described as y=c ($x_1 \le x \le x_2$). The x-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss quadrature on $[x_1, x_2]$. And the y-coordinates of the Gauss quadrature nodes are fixed to be c.
- Case 3: Otherwise, a boundary edge can be described as y = ax + b ($x_1 \le x \le x_2$). The x-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss nodes in $[x_1, x_2]$. And the y-coordinates of the Gauss quadrature nodes are obtained from y = ax + b.
- The case 3 with a = 0 and b = c is equivalent to case 2. Hence case 2 and case 3 can be combined into one case.

FE Method

Assemble the non-zero local integrals into \vec{v} :

- When the test function is ϕ_i , the corresponding non-zero local integrals should be assembled to v_i .
- Therefore, if we find the global node indices of the test basis functions, we can easily locate where to assemble a non-zero local integral.
- Question: Since we compute

$$\int_{e_k} c p \psi_{n_k \beta} \ ds \ (eta = 1, \cdots, N_{lb})$$

instead of

$$\int_{\rho_{l}} cp\phi_{i} ds (i = p_{1}, \cdots, p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local test basis functions $\psi_{n_k\beta}$ ($\beta = 1, \dots, N_{lb}$)?

Information matrix T_h!

More Discussion

• Recall that $T_b(\beta, n_k)$ give the global node indices of the local test basis functions $\psi_{n_k\beta}$ ($\beta = 1, \dots, N_{lb}$).

Dirichlet boundary condition

• That is,

Weak/Galerkin formulation

$$\int_{e_k} cp\psi_{n_k\beta} \ ds \ (\beta=1,\cdots,N_{lb})$$

should be assembled to v_i where $i = T_b(\beta, n_k)$.

Algorithm VI-1:

- Initialize the vector: $v = sparse(N_b, 1)$;
- Compute the integrals and assemble them into v:

```
FOR k = 1, \dots, nbe:
      IF boundaryedges (1, k) shows Neumann boundary
condition, THEN
            n_k = boundaryedges(2, k);
            FOR \beta = 1, \dots, N_{lb}:
                 Compute r = \int_{\mathbf{e}_{l}} c\mathbf{p} \psi_{n_{k}\beta} ds;
                 v(T_b(\beta, n_k), 1) = v(T_b(\beta, n_k), 1) + r;
            END
      ENDIF
FND
```

Weak/Galerkin formulation

• If we follow Algorithm VI-1 to develop a subroutine to assemble the vector arising from

$$\int_{e_k} \tilde{p} \frac{\partial^{a+b} \psi_{n_k \beta}}{\partial x^a \partial y^b} \ ds,$$

Dirichlet boundary condition

then Algorithm VI-1 is equivalent to calling this subroutine with parameters: a = b = 0 and $\tilde{p} = cp$.

Algorithm VI:

- Initialize the vector: $v = sparse(N_b, 1)$;
- Compute the integrals and assemble them into v:

```
FOR k = 1, \dots, nbe:
```

IF boundaryedges (1, k) shows Neumann boundary condition, THEN

```
n_k = boundaryedges(2, k);
FOR \beta = 1, \dots, N_{lb}:
        Compute r = \int_{e_k} \tilde{p} \frac{\partial^{a+b} \psi_{n_k \beta}}{\partial x^a \partial v^b} ds;
        v(T_b(\beta, n_k), 1) = v(T_b(\beta, n_k), 1) + r;
END
```

ENDIF

END

Recall

- Matrix boundarynodes:
- boundarynodes(1, k) is the type of the k^{th} boundary finite element node: Dirichlet (-1), Neumann (-2), Robin (-3).....
- The intersection nodes of Dirichlet boundary condition and other boundary conditions usually need to be treated as Dirichlet boundary nodes.
- boundarynodes(2, k) is the global node index of the k^{th} boundary boundary finite element node.
- Set nbn = size(boundarynodes, 2) to be the number of boundary finite element nodes;

• Example 2: Use the finite element method to solve the following equation on the domain $\Omega = [-1, 1] \times [-1, 1]$:

$$-\nabla \cdot (\nabla u) = -2e^{x+y},
 u = e^{-1+y} \text{ on } x = -1,
 u = e^{1+y} \text{ on } x = 1,
 \nabla u \cdot \vec{n} = -e^{x-1} \text{ on } y = -1,
 u = e^{x+1} \text{ on } y = 1.$$

• The analytic solution of this problem is $u = e^{x+y}$, which can be used to compute the error of the numerical solution.

1/128	2.8155×10^{-8}	9.5686×10^{-9}	1.1667×10^{-5}

Table: The numerical errors for quadratic finite element.

- Any Observation?
- Third order convergence $O(h^3)$ in L^2/L^{∞} norm and second order convergence $O(h^2)$ in H^1 semi-norm, which match the optimal approximation capability expected from piecewise quadratic functions.

Consider

$$\begin{aligned} -\nabla \cdot (c\nabla u) &= f & \text{in } \Omega, \\ \nabla u \cdot \vec{n} + ru &= q & \text{on } \Gamma_R \subseteq \partial \Omega, \\ u &= g & \text{on } \partial \Omega / \Gamma_R. \end{aligned}$$

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy - \int_{\partial \Omega} \left(c \nabla u \cdot \vec{n} \right) v \ ds = \int_{\Omega} f v \ dx dy.$$

• Since the solution on $\partial \Omega/\Gamma_R$ is given by u=g, then we can choose the test function v(x) such that v=0 on $\partial\Omega/\Gamma_R$.

Since

$$\int_{\partial\Omega} (c\nabla u \cdot \vec{n}) v \, ds = \int_{\Gamma_R} (c\nabla u \cdot \vec{n}) v \, ds + \int_{\partial\Omega/\Gamma_R} (c\nabla u \cdot \vec{n}) v \, ds$$
$$= \int_{\Gamma_R} c(q - ru) v \, ds$$
$$= \int_{\Gamma} cqv \, ds - \int_{\Gamma} cruv \, ds,$$

then

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy - \left(\int_{\Gamma_R} cqv \, ds - \int_{\Gamma_R} cruv \, ds \right) = \int_{\Omega} fv \, dx dy$$

Hence the weak formulation is

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy + \int_{\Gamma_R} cruv \, ds = \int_{\Omega} fv \, dx dy + \int_{\Gamma_R} cqv \, ds.$$

ullet Then the Galerkin formulation is to find $u_h \in U_h$ such that

$$\int_{\Omega} c \nabla u_h \cdot \nabla v_h \, dx dy + \int_{\Gamma_R} c r u_h v_h \, ds = \int_{\Omega} f v_h \, dx dy + \int_{\Gamma_R} c q v_h \, ds$$

for any $v_h \in U_h$.

• Recall: Since $u_h \in U_h = span\{\phi_j\}_{j=1}^{N_b}$, then

$$u_h = \sum_{j=1}^{N_b} u_j \phi_j$$

for some coefficients u_j $(j = 1, \dots, N_b)$.

• Recall: Choose $v_h = \phi_i$ $(i = 1, \dots, N_b)$.

• Then for $i = 1, \dots, N_b$, the finite element formulation gives

$$\int_{\Omega} c \nabla \left(\sum_{j=1}^{N_b} u_j \phi_j \right) \cdot \nabla \phi_i \, dx dy + \int_{\Gamma_R} cr \left(\sum_{j=1}^{N_b} u_j \phi_j \right) \phi_i \, ds$$

$$= \int_{\Omega} f \phi_i \, dx dy + \int_{\Gamma_R} cq \phi_i \, ds,$$

$$\Rightarrow \sum_{j=1}^{N_b} u_j \left[\int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right] + \sum_{j=1}^{N_b} u_j \left[\int_{\Gamma_R} cr \phi_j \phi_i \, ds \right]$$

$$= \int_{\Omega} f \phi_i \, dx dy + \int_{\Gamma_R} cq \phi_i \, ds.$$

Recall: Define the stiffness matrix

$$A = [a_{ij}]_{i,j=1}^{N_b} = \left[\int_{\Omega} c \nabla \phi_j \cdot \nabla \phi_i \, dx dy \right]_{i,j=1}^{N_b}.$$

Recall: Define the load vector

$$\vec{b} = [b_i]_{i=1}^{N_b} = \left[\int_{\Omega} f \phi_i \, dx dy \right]_{i=1}^{N_b}.$$

Recall: Define the unknown vector

$$\vec{X} = [u_j]_{j=1}^{N_b}.$$

Define the additional vector from the Robin boundary condition

$$\vec{w} = [w_i]_{i=1}^{N_b} = \left[\int_{\Gamma_R} cq\phi_i \ ds \right]_{i=1}^{N_b}.$$

FE Method

Robin boundary condition

Define the additional matrix from the Robin boundary condition

$$R = [r_{ij}]_{i,j=1}^{N_b} = \left[\int_{\Gamma_R} cr \phi_j \phi_i \ ds \right]_{i,j=1}^{N_b}.$$

- Define the new vector $\vec{\vec{b}} = \vec{b} + \vec{w}$.
- Define the new matrix $\widetilde{A} = A + R$.
- Then we obtain the linear algebraic system

$$\widetilde{A}\vec{X} = \widetilde{\vec{b}}.$$

- Code?
- Add one more subroutine for \vec{w} and R to the existing code!

Recall

- Matrix boundaryedges:
- boundaryedges(1, k) is the type of the k^{th} boundary edge e_k : Dirichlet (-1), Neumann (-2), Robin (-3).....
- boundaryedges(2, k) is the index of the element which contains the k^{th} boundary edge e_k .
- Each boundary edge has two end nodes. We index them as the first and the second counterclock wise along the boundary.
- boundaryedges(3, k) is the global node index of the first end node of the k^{th} boundary boundary edge e_k .
- boundaryedges(4, k) is the global node index of the second end node of the k^{th} boundary boundary edge e_k .
- Set nbe = size(boundaryedges, 2) to be the number of boundary edges; 4 D > 4 M > 4 B > 4 B > B

• The idea for the assembly of the matrix R and the vector \vec{w} is similar to that of the stiffness matrix and the load vector. We have

$$w_{i} = \int_{\Gamma_{R}} cq\phi_{i} ds = \sum_{\substack{e_{k} \subset \Gamma_{R} \\ 1 \leq k \leq nbe}} \int_{e_{k}} cq\phi_{i} ds, i = 1, \cdots, N_{b},$$

$$r_{ij} = \int_{\Gamma_{R}} cr\phi_{j}\phi_{i} ds = \sum_{\substack{e_{k} \subset \Gamma_{R} \\ 1 \leq k \leq nbe}} \int_{e_{k}} cr\phi_{j}\phi_{i} ds, i, j = 1, \cdots, N_{b}.$$

- Loop over all the boundary edges;
- Compute all non-zero local integrals on each Robin boundary edge for the vector \vec{w} and the matrix R;
- Assemble these non-zero local integrals into the corresponding entries of the vector \vec{w} and the matrix R.

Weak/Galerkin formulation

Compute all non-zero local integrals on each Robin boundary edge for the vector \vec{w} and the matrix R:

Dirichlet boundary condition

- The index of the element which contains the k^{th} boundary edge e_k is $n_k = boundaryedges(2, k)$. Then on e_k , we get non-zero local integrals only when the test and trial basis functions are corresponding to the finite element nodes of the n_k^{th} element E_{n_k} .
- Let $p_s = T_b(s, n) \ (s = 1, \dots, N_{lb}).$
- Then we only consider the test basis functions to be ϕ_{p_s} ($s=1,\cdots,N_{lb}$).

• There are only N_{lb} non-zero local integrals on e_k with the global basis functions ϕ_{D_s} $(s=1,\cdots,N_{lb})$:

$$\int_{e_k} cq\phi_i \; ds, \; i=p_1,\cdots,p_{N_{lb}},$$
 $\int_{e_k} cr\phi_j\phi_i \; ds, \; i,j=p_1,\cdots,p_{N_{lb}}.$

In fact, we have

$$\psi_{n_k s} = \phi_{p_s}|_{E_{n_k}} \ (s = 1, \cdots, N_{lb}).$$

Weak/Galerkin formulation

 That is, instead of the original non-zero local integrals with the global basis functions ϕ_{p_s} $(s = 1, \dots, N_{lb})$, we will compute the following non-zero local integrals with the local basis functions $\psi_{n_k s}$ $(s = 1, \dots, N_{lb})$:

Dirichlet boundary condition

$$\int_{\mathsf{e}_k} \mathsf{c} \mathsf{p} \psi_{\mathsf{n}_k eta} \; \mathsf{d} \mathsf{s}, \; eta = 1, \cdots, \mathsf{N}_{\mathit{lb}},$$
 $\int_{\mathsf{e}_k} \mathsf{c} \mathsf{r} \psi_{\mathsf{n}_k eta} \psi_{\mathsf{n}_k lpha} \; \mathsf{d} \mathsf{s}, \; lpha, eta = 1, \cdots, \mathsf{N}_{\mathit{lb}}.$

- Question: how to compute these integrals?
- Gauss quadrature. The needed information is stored in the matrices P and boundaryedges.

Recall

• P(:, boundaryedges(3:4, k)) provides the coordinates of the two end points of the k^{th} boundary edge. We discuss three cases based on these coordinates.

Dirichlet boundary condition

• Case 1: If a boundary edge is vertical, then it can be described as x = c ($y_1 \le y \le y_2$). The y-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss quadrature on $[y_1, y_2]$. And the x-coordinates of the Gauss quadrature nodes are fixed to be c.

- Case 2: If a boundary edge is horizontal, then it can be described as y=c ($x_1 \le x \le x_2$). The x-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss quadrature on $[x_1, x_2]$. And the y-coordinates of the Gauss quadrature nodes are fixed to be c.
- Case 3: Otherwise, a boundary edge can be described as y = ax + b ($x_1 \le x \le x_2$). The x-coordinates of the Gauss quadrature nodes on this boundary edge and the Gauss quadrature weights can be obtained from the 1D local Gauss nodes in $[x_1, x_2]$. And the y-coordinates of the Gauss quadrature nodes are obtained from y = ax + b.
- The case 3 with a = 0 and b = c is equivalent to case 2. Hence case 2 and case 3 can be combined into one case.

Assemble the non-zero local integrals into \vec{w} and R:

- When the test function is ϕ_i , the corresponding non-zero local integrals should be assembled to w_i .
- When the trial function is ϕ_i and the test function is ϕ_i , the corresponding non-zero local integrals should be assembled to r_{ii}
- Therefore, if we find the global node indices of the trial and test basis functions, we can easily locate where to assemble a non-zero local integral.

• Question: Since we compute

$$\int_{e_k} cq\psi_{n_k\beta} \ ds \ (\beta=1,\cdots,N_{lb})$$

Dirichlet boundary condition

instead of

$$\int_{P_{l}} cq\phi_{i} \ ds \ (i=p_{1},\cdots,p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local test basis functions $\psi_{n_k\beta}$ ($\beta=1,\cdots,N_{lb}$)?

• Question: Since we compute

$$\int_{e_{\nu}} cr \psi_{n_k \beta} \psi_{n_k \alpha} ds (\alpha, \beta = 1, \cdots, N_{lb})$$

instead of

$$\int_{e_{l}} cr \phi_{j} \phi_{i} \ ds \ (i, j = p_{1}, \cdots, p_{N_{lb}}),$$

how do we obtain the corresponding global node indices of the local trial and test basis functions $\psi_{n_k\alpha}$ and $\psi_{n_k\beta}$ $(\alpha, \beta = 1, \cdots, N_{lb})$?

• Information matrix $T_h!$

FE Method

- Recall that $T_b(\alpha, n_k)$ and $T_b(\beta, n_k)$ give the global node indices of the local trial and test basis functions $\psi_{n_{\nu}\alpha}$ and $\psi_{n_{l}\beta}$ $(\alpha, \beta = 1, \cdots, N_{lb}).$
- That is,

$$\int_{e_k} cq\psi_{n_k\beta} \ ds \ (\beta=1,\cdots,N_{lb})$$

should be assembled to w_i where $i = T_b(\beta, n_k)$.

And

$$\int_{e_{\nu}} cr \psi_{n_k \alpha} \psi_{n_k \beta} \ ds \ (\alpha, \beta = 1, \cdots, N_{lb})$$

should be assembled to r_{ii} where $i = T_b(\beta, n_k)$ and $i = T_b(\alpha, n_k)$.

```
Algorithm VII-1:
```

```
• Initialize R = sparse(N_b, N_b) and w = sparse(N_b, 1);
```

• Compute the integrals and assemble them into R and w:

```
FOR k = 1, \dots, nbe:
```

END ENDIF

```
IF boundaryedges(1, k) shows Robin boundary condition, THEN n_k = boundaryedges(2, k); FOR \ \beta = 1, \cdots, N_{lb}; Compute \ r = \int_{e_k} cq\psi_{n_k\beta} \ ds; w(T_b(\beta, n_k), 1) = w(T_b(\beta, n_k), 1) + r; END FOR \ \alpha = 1, \cdots, N_{lb}; FOR \ \beta = 1, \cdots, N_{lb}; Compute \ r = \int_{e_k} cr\psi_{n_k\beta}\psi_{n_k\alpha} \ ds; Add \ r \ to \ R(T_b(\beta, n_k), T_b(\alpha, n_k)); END
```

Algorithm VII-2:

END

- Initialize $R = sparse(N_b, N_b)$ and $w = sparse(N_b, 1)$;
- Compute the integrals and assemble them into R and w:

```
FOR k = 1, \dots, nbe:
      IF boundaryedges (1, k) shows Robin boundary condition, THEN
            n_k = boundaryedges(2, k);
            FOR \beta = 1, \dots, N_{lb}:
                  Compute r = \int_{e_k} cq\psi_{n_k\beta} ds;
                  w(T_b(\beta, n_k), 1) = w(T_b(\beta, n_k), 1) + r;
                  FOR \alpha = 1, \dots, N_{lb}:
                        Compute r = \int_{e_{l}} cr \psi_{n_{k}\beta} \psi_{n_{k}\alpha} ds;
                        Add r to R(T_b(\beta, n_k), T_b(\alpha, n_k));
                  FND
            END
      ENDIF
```

• If we follow Algorithm VII-1 to develop a subroutine to assemble the vector arising from

$$\int_{e_k} \tilde{p} \frac{\partial^{a+b} \psi_{n_k \beta}}{\partial x^a \partial y^b} \ ds,$$

and the vector arising from

$$\int_{e_k} \tilde{r} \frac{\partial^{m+s} \psi_{n_k \alpha}}{\partial x^m \partial y^s} \frac{\partial^{d+l} \psi_{n_k \beta}}{\partial x^d \partial y^l} \ ds,$$

then Algorithm VII-1 is equivalent to calling this subroutine with parameters: a = b = r = s = d = l = 0, $\tilde{p} = cq$, and $\tilde{r} = cr$

 Note that the vector part is exactly the same as what we had for the Neumann boundary condition!

```
Algorithm VII:
```

```
• Initialize R = sparse(N_b, N_b) and w = sparse(N_b, 1);
```

Compute the integrals and assemble them into R and w:

```
FOR k = 1, \dots, nbe:
```

```
IF boundaryedges (1, k) shows Robin boundary condition, THEN
      n_k = boundaryedges(2, k);
      FOR \beta = 1, \dots, N_{lb}:
             Compute r = \int_{e_k} \tilde{p} \frac{\partial^{a+b} \psi_{n_k \beta}}{\partial x^a \partial x^b} ds;
             w(T_b(\beta, n_k), 1) = w(T_b(\beta, n_k), 1) + r;
      END
      FOR \ \alpha = 1, \cdots, N_{lb}:
             FOR \beta = 1, \dots, N_{lb}:
                     Compute r = \int_{e_k} cr \psi_{n_k \beta} \psi_{n_k \alpha} ds;
                    Add r to R(T_b(\beta, n_k), T_b(\alpha, n_k));
              FND
      FND
```

FNDIF

Recall

Weak/Galerkin formulation

- Matrix boundarynodes:
- boundarynodes(1, k) is the type of the k^{th} boundary finite element node: Dirichlet (-1), Neumann (-2), Robin (-3).....
- The intersection nodes of Dirichlet boundary condition and other boundary conditions usually need to be treated as Dirichlet boundary nodes.
- boundarynodes(2, k) is the global node index of the k^{th} boundary boundary finite element node.
- Set nbn = size(boundarynodes, 2) to be the number of boundary finite element nodes:

• Example 3: Use the finite element method to solve the following equation on the domain $\Omega = [-1, 1] \times [-1, 1]$:

$$-\nabla \cdot (\nabla u) = -2e^{x+y},
 u = e^{-1+y} \text{ on } x = -1,
 u = e^{1+y} \text{ on } x = 1,
 \nabla u \cdot \vec{n} + u = 0 \text{ on } y = -1,
 u = e^{x+1} \text{ on } y = 1.$$

• The analytic solution of this problem is $u = e^{x+y}$, which can be used to compute the error of the numerical solution.

- Third order convergence $iO(h^3)$ in L^2/L^{∞} norm and second order convergence $O(h^2)$ in H^1 semi-norm, which match the optimal approximation capability expected from piecewise quadratic functions.

Dirichlet/Neumann/Robin mixed boundary condition

Consider

$$-\nabla \cdot (c\nabla u) = f \text{ in } \Omega,$$

$$\nabla u \cdot \vec{n} = p \text{ on } \Gamma_N \subset \partial \Omega,$$

$$\nabla u \cdot \vec{n} + ru = q \text{ on } \Gamma_R \subseteq \partial \Omega,$$

$$u = g \text{ on } \partial \Omega / (\Gamma_N \cup \Gamma_R).$$

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy - \int_{\partial \Omega} (c \nabla u \cdot \vec{n}) \, v \, ds = \int_{\Omega} f v \, dx dy.$$

• Since the solution on $\partial\Omega/(\Gamma_N\cup\Gamma_R)$ is given by u=g, then we can choose the test function v(x) such that v=0 on $\partial\Omega/(\Gamma_N\cup\Gamma_R)$.

Dirichlet/Neumann/Robin mixed boundary condition

Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dx dy + \int_{\Gamma_R} cruv \, ds$$

$$= \int_{\Omega} fv \, dx dy + \int_{\Gamma_N} cpv \, ds + \int_{\Gamma_R} cqv \, ds.$$

Dirichlet boundary condition

- Code?
- Combine all of the subroutines for Dirichlet/Neumann/Robin boundary conditions.

Non-isotropic equation

Consider

$$\begin{array}{l}
-\nabla \cdot (c\nabla u) = f & \text{in } \Omega, \\
c\nabla u \cdot \vec{n} = p & \text{on } \Gamma_N \subset \partial \Omega, \\
c\nabla u \cdot \vec{n} + ru = q & \text{on } \Gamma_R \subseteq \partial \Omega, \\
u = g & \text{on } \partial \Omega / (\Gamma_N \cup \Gamma_R),
\end{array}$$

where

$$c=\left(\begin{array}{cc}c_{11}&c_{12}\\c_{21}&c_{22}\end{array}\right).$$

Recall

$$\int_{\Omega} c \nabla u \cdot \nabla v \ dx dy - \int_{\partial \Omega} \left(c \nabla u \cdot \vec{n} \right) v \ ds = \int_{\Omega} f v \ dx dy.$$

Non-isotropic equation

- Since the solution on $\partial\Omega/(\Gamma_N \cup \Gamma_R)$ is given by u=g, then we can choose the test function v(x) such that v=0 on $\partial \Omega/(\Gamma_N \cup \Gamma_R)$.
- Hence

Weak/Galerkin formulation

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dxdy + \int_{\Gamma_R} ruv \, ds$$

$$= \int_{\Omega} fv \, dxdy + \int_{\Gamma_N} pv \, ds + \int_{\Gamma_R} qv \, ds.$$

where

$$c\nabla u \cdot \nabla v = \begin{pmatrix} c_{11} & c_{12} \\ c_{21} & c_{22} \end{pmatrix} \begin{pmatrix} u_{x} \\ u_{y} \end{pmatrix} \cdot \begin{pmatrix} v_{x} \\ v_{y} \end{pmatrix}$$

$$= \begin{pmatrix} c_{11}u_{x} + c_{12}u_{y} \\ c_{21}u_{x} + c_{22}u_{y} \end{pmatrix} \cdot \begin{pmatrix} v_{x} \\ v_{y} \end{pmatrix}$$

$$= c_{11}u_{x}v_{x} + c_{12}u_{y}v_{x} + c_{21}u_{x}v_{y} + c_{22}u_{y}v_{y}.$$

FE Method

Non-isotropic equation

- Code? Just call Algorithm I-3 four times! Everything else is the same as before!
- Call Algorithm I-3 with r=1, s=0, p=1, q=0, and $c = c_{11}$ to obtain A_1 ;
- Call Algorithm I-3 with r = 0, s = 1, p = 1, q = 0, and $c = c_{11}$ to obtain A_2 :
- Call Algorithm I-3 with r = 1, s = 0, p = 0, q = 1, and $c = c_{21}$ to obtain A_3 ;
- Call Algorithm I-3 with r=0, s=1, p=0, q=1, and $c = c_{22}$ to obtain A_4 .
- Then the stiffness matrix is $A = A_1 + A_2 + A_3 + A_4$.

A more general second order equation

Consider

$$-\nabla \cdot (c\nabla u) + au = f \text{ in } \Omega,$$

$$c\nabla u \cdot \vec{n} = p \text{ on } \Gamma_N \subset \partial \Omega,$$

$$c\nabla u \cdot \vec{n} + ru = q \text{ on } \Gamma_R \subseteq \partial \Omega,$$

$$u = g \text{ on } \partial \Omega / (\Gamma_N \cup \Gamma_R),$$

where

$$c=\left(\begin{array}{cc}c_{11}&c_{12}\\c_{21}&c_{22}\end{array}\right).$$

Then

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dxdy - \int_{\partial \Omega} (c \nabla u \cdot \vec{n}) v \, ds + \int_{\Omega} auv \, dxdy = \int_{\Omega} fv \, dxdy.$$

A more general second order equation

- Since the solution on $\partial\Omega/(\Gamma_N \cup \Gamma_R)$ is given by u=g, then we can choose the test function v(x) such that v=0 on $\partial \Omega/(\Gamma_N \cup \Gamma_R)$.
- Hence

$$\int_{\Omega} c \nabla u \cdot \nabla v \, dxdy + \int_{\Omega} auv \, dxdy + \int_{\Gamma_R} ruv \, ds$$

$$= \int_{\Omega} fv \, dxdy + \int_{\Gamma_N} pv \, ds + \int_{\Gamma_R} qv \, ds.$$

where

$$c\nabla u \cdot \nabla v = c_{11}u_xv_x + c_{12}u_yv_x + c_{21}u_xv_y + c_{22}u_yv_y.$$

A more general second order equation

- Code? Just call Algorithm I-3 five times! Everything else is the same as before!
- Call Algorithm I-3 with r=0, s=0, p=0, q=0, and c=ato obtain A_0 ;
- Call Algorithm I-3 with r=1, s=0, p=1, q=0, and $c = c_{11}$ to obtain A_1 ;
- Call Algorithm I-3 with r = 0, s = 1, p = 1, q = 0, and $c = c_{11}$ to obtain A_2 ;
- Call Algorithm I-3 with r = 1, s = 0, p = 0, q = 1, and $c = c_{21}$ to obtain A_3 ;
- Call Algorithm I-3 with r=0, s=1, p=0, q=1, and $c = c_{22}$ to obtain A_4 .
- Then the stiffness matrix is $A = A_0 + A_1 + A_2 + A_3 + A_4$.

Linear regression for the convergence order

- Consider $||u u_h|| = Ch^r$.
- The goal is to design a linear regression to obtain the C and r based on the h and errors given in the table.
- First,

$$log(||u - u_h||) = log(Ch^r)$$

$$= log(C) + log(h^r)$$

$$= log(C) + r log(h).$$

- Let $y = log(||u u_h||), x = log(h), a = r, b = log(C).$
- Then y = ax + b.
- For different h, we can obtain the corresponding x and y.
- Then by the regular linear regression, we can obtain a and b, which give us the $C = e^b$ and r = a.
